

Science and technology are present in our daily lives. But, what do we know about subjects as poorly known as Crystallography?.

Hundreds products that surround us every day have been handled by a crystallographer or a crystal grower at some point during their development. Drugs, foods, paints, computer and mobile phones chips, new materials at the frontier of technology, etc.

In this new section of Triana Science & Technology we wish to offer educational and entertainment product to approach the society to the wonderful but unknown world of crystals.

*Science and technology are present in our daily lives. But, what do we know about subjects as poorly known as Crystallography?*
